[Early History Of The Atom Homework Answers](#)

1. When connected to a power source, one end plate becomes negative and one becomes positive.

2. Thompson discovered that electric current flowed through the tube from the negative end plate to the positive end plate. This showed that electric current is negative in charge.

3. Thompson observed that the positive and negative plates along the sides of the tube caused the electric current to bend toward the side with the positive plate. This showed that the charge is carried by particles of matter (rather than by rays).
